Abstract

We give two different simple proofs for the removable singularities of the heat equation in $(\Omega \setminus \{x_0\}) \times (0, T)$ where $x_0 \in \Omega \subset \mathbb{R}^n$ is a bounded domain with $n \geq 3$. We also give a necessary and sufficient condition for removable singularities of the heat equation in $(\Omega \setminus \{x_0\}) \times (0, T)$ for the case $n = 2$.

Key words: removable singularities, heat equation

Mathematics Subject Classification: Primary 35B65 Secondary 35K55, 35K05, 35K20

Singularities of solutions of partial differential equations appear in many problems. For example singularities appears in the study of the solutions of the harmonic map [13] and the harmonic map heat flow [3]. In [14] S. Sato and E. Yanagida studied the solutions for a semilinear parabolic equation with moving singularities. Singularities of solutions also appears in the study of hyperbolic partial differential equations [15] and in the study of the touchdown behavior of the micro-electromechanical systems equation [4], [5], [6].

It is interesting to find the necessary and sufficient condition for the solutions of the equations to have removable singularities. In [8] S.Y. Hsu proved the following theorem.

Theorem 1. *Let $n \geq 3$ and let $0 \in \Omega \subset \mathbb{R}^n$ be a domain. Suppose u is a solution of the heat equation*

$$u_t = \Delta u \tag{1}$$

in $(\Omega \setminus \{0\}) \times (0, T)$. Then u has removable singularities at $\{0\} \times (0, T)$ if and only if for any $0 < t_1 < t_2 < T$ and $\delta \in (0, 1)$ there exists $\overline{B_{R_0}(0)} \subset \Omega$ depending on t_1, t_2 and δ , such that

$$|u(x, t)| \leq \delta |x|^{2-n} \tag{2}$$

for any $0 < |x| \leq R_0$ and $t_1 \leq t \leq t_2$.

The proof in [8] is based on the Green function estimates of [9] and a careful analysis of the behavior of the solution near the singularities using Dehamel principle. In this paper we will use the Schauder estimates for heat equation [2], [12], and the technique of [1] and [7] to give two different simple proofs of the above result. We also obtain the following result for the solution of the heat equation in 2-dimension.

Theorem 2. *Let $0 \in \Omega \subset \mathbb{R}^2$ be a domain. Suppose u is a solution of the heat equation in $(\Omega \setminus \{0\}) \times (0, T)$. Then u has removable singularities at $\{0\} \times (0, T)$ if and only if for any $0 < t_1 < t_2 < T$ and $\delta \in (0, 1)$ there exists $\overline{B}_{R_0}(0) \subset \Omega$ depending on t_1, t_2 and δ , such that*

$$|u(x, t)| \leq \delta(\log(1/|x|))^{-1} \quad (3)$$

for any $0 < |x| \leq R_0$ and $t_1 \leq t \leq t_2$.

Remark 3. *Note that the function $\log |x|$ satisfies the heat equation in $(\mathbb{R}^2 \setminus \{0\}) \times (0, \infty)$ but it has non-removable singularities on $\{0\} \times (0, \infty)$ and it does not satisfy (3). Hence (3) is sharp.*

We start with some definitions. For any set A we let χ_A be the characteristic function of the set A . Let $0 \in \Omega \subset \mathbb{R}^n$ be a bounded domain. We say that a solution u of the heat equation (1) in $(\Omega \setminus \{0\}) \times (0, T)$ has removable singularities at $\{0\} \times (0, T)$ if there exists a classical solution v of (1) in $\Omega \times (0, T)$ such that $u = v$ in $(\Omega \setminus \{0\}) \times (0, T)$. For any $R > 0$ let $B_R = B_R(0) = \{x : |x| < R\} \subset \mathbb{R}^n$.

Proof of Theorem 1: Suppose u has removable singularities at $\{0\} \times (0, T)$. By the same argument as the proof in section 3 of [8] for any $0 < t_1 < t_2 < T$ and $\delta \in (0, 1)$ there exists $\overline{B}_{R_0} \subset \Omega$ depending on t_1, t_2 and δ , such that (2) holds.

Suppose (2) holds. Then for any $0 < t_1 < t_2 < T$ and $\delta \in (0, 1)$ there exists $\overline{B}_{R_0} \subset \Omega$ depending on t_1, t_2 and δ , such that (2) holds for any $0 < |x| \leq R_0$ and $t_1 \leq t \leq t_2$.

For any $0 < |x| \leq R_0$, let

$$w(y, s) = u(|x|y, |x|^2s) \quad \forall 0 < |y| \leq R_0/|x|, t_1/|x|^2 \leq s \leq t_2/|x|^2. \quad (4)$$

Then w is a solution of (1) in $(\overline{B}_1 \setminus \{0\}) \times (|x|^{-2}t_1, |x|^{-2}t_2)$. By (2),

$$|w(y, s)| \leq \delta(|x||y|)^{2-n} \quad \forall 0 < |y| \leq R_0/|x|, t_1/|x|^2 \leq s \leq t_2/|x|^2. \quad (5)$$

Let $t_1 < t_3 < t_2$. Then

$$\frac{t_3}{|x|^2} - \frac{t_1}{|x|^2} \geq \frac{t_3 - t_1}{R_0^2} \quad (6)$$

By the parabolic Schauder estimates [2], [12], (5) and (6), there exists a constant $C_1 > 0$ such that

$$|\nabla w(y, s)| \leq C_1 \sup_{\substack{1/2 \leq |z| \leq 1 \\ |x|^{-2}t_1 \leq \tau \leq |x|^{-2}t_2}} w(z, \tau) \leq C_2 \delta |x|^{2-n} \quad (7)$$

holds for any $2/3 \leq |y| \leq 3/4$, $t_3/|x|^2 \leq s \leq t_2/|x|^2$ where $C_2 = 2^{n-2}C_1$. By (4) and (7),

$$\begin{aligned} |\nabla u(z, t)| &\leq C_2 \delta |x|^{1-n} \quad \forall |z| = \frac{3}{4}|x|, 0 < |x| \leq R_0, t_3 \leq t \leq t_2 \\ \Rightarrow |\nabla u(z, t)| &\leq C_2 \delta |z|^{1-n} \quad \forall |z| \leq \frac{3}{4}R_0, t_3 \leq t \leq t_2. \end{aligned} \quad (8)$$

Let $R_1 = 3/(4R_0)$. We will now use a modification of the proof of Lemma 2.3 of [1] and Lemma 2.1 of [7] to complete the argument. We will first show that u satisfies (1) in $\Omega \times (t_1, t_2)$ in the distribution sense. Since u satisfies (1) in $(\Omega \setminus \{0\}) \times (0, T)$, for any $0 < \varepsilon < R_1$ and $\eta \in C_0^\infty(\Omega \times (0, T))$ we have

$$\begin{aligned} \int_{\Omega \setminus B_\varepsilon} u \eta dx \Big|_{t_3}^{t_2} &= \int_{t_3}^{t_2} \int_{\Omega \setminus B_\varepsilon} u \eta_t dx dt - \int_{t_3}^{t_2} \int_{\Omega \setminus B_\varepsilon} \nabla u \cdot \nabla \eta dx dt \\ &\quad - \int_{t_3}^{t_2} \int_{\partial B_\varepsilon} \eta \frac{\partial u}{\partial n} d\sigma dt \end{aligned} \quad (9)$$

where $\partial u / \partial n$ is the derivative of u with respect to the unit outward normal at ∂B_ε . By (8),

$$\limsup_{\varepsilon \rightarrow 0} \left| \int_{t_3}^{t_2} \int_{\partial B_\varepsilon} \eta \frac{\partial u}{\partial n} d\sigma dt \right| \leq C_2 \delta (t_2 - t_3) |\partial B_1| \|\eta\|_{L^\infty}$$

Since $\delta > 0$ is arbitrary, there holds

$$\lim_{\varepsilon \rightarrow 0} \int_{t_3}^{t_2} \int_{\partial B_\varepsilon} \eta \frac{\partial u}{\partial n} d\sigma dt dx dt = 0. \quad (10)$$

By (8) and the Lebesgue dominated convergence theorem,

$$\lim_{\varepsilon \rightarrow 0} \int_{t_3}^{t_2} \int_{\Omega \setminus B_\varepsilon} \nabla u \cdot \nabla \eta dx dt = \int_{t_3}^{t_2} \int_{\Omega} \nabla u \cdot \nabla \eta dx dt \quad (11)$$

Letting $\varepsilon \rightarrow 0$ in (9), by (10) and (11) there holds

$$\int_{\Omega} u \eta dx \Big|_{t_3}^{t_2} = \int_{t_3}^{t_2} \int_{\Omega} u \eta_t dx dt - \int_{t_3}^{t_2} \int_{\Omega} \nabla u \cdot \nabla \eta dx dt \quad \forall t_3 \in (t_1, t_2). \quad (12)$$

Hence u is a distribution solution of (1) in $\Omega \times (t_1, t_2)$. By (2) for any $1 \leq p < \frac{n}{n-2}$ there exists a constant $C'_p > 0$ such that

$$\sup_{t_1 \leq t \leq t_2} \int_{B_{R_0}} u(x, t)^p dx \leq C'_p \quad (13)$$

By (12) and (13) and an argument similar to the proof of [11] and section 1 of [10] $u \in L_{loc}^\infty(B_{R_0} \times (t_1, t_2))$. We now let v be the solution of

$$\begin{cases} v_t = \Delta v & \text{in } B_{R_1} \times (t_3, t_2) \\ \frac{\partial v}{\partial n}(x, t) = \frac{\partial u}{\partial n}(x, t) & \text{on } \partial B_{R_1} \times (t_3, t_2) \\ v(x, t_3) = u(x, t_3) & \text{in } B_{R_1}. \end{cases} \quad (14)$$

For any $0 \leq h \in C_0^\infty(B_{R_1})$ and $t_3 < t \leq t_2$ let η be the solution of

$$\begin{cases} \eta_t + \Delta \eta = 0 & \text{in } B_{R_1} \times (t_3, t) \\ \frac{\partial \eta}{\partial n}(x, t) = 0 & \text{on } \partial B_{R_1} \times (t_3, t) \\ \eta(x, t) = h(x) & \text{in } B_{R_1}. \end{cases} \quad (15)$$

By the maximum principle,

$$0 \leq \eta \leq \|h\|_{L^\infty} \quad \text{in } B_{R_1} \times (t_3, t). \quad (16)$$

Then by (14) and (15),

$$\begin{aligned} \left. \int_{B_{R_1} \setminus B_\varepsilon} (u - v) \eta dx \right|_{t_3}^t &= \int_{t_3}^t \int_{B_{R_1} \setminus B_\varepsilon} [(u - v) \eta_t + (u - v)_t \eta] dx dt \\ &= \int_{t_3}^t \int_{B_{R_1} \setminus B_\varepsilon} [(u - v) \eta_t + \Delta(u - v) \eta] dx dt \\ &= \int_{t_3}^t \int_{B_{R_1} \setminus B_\varepsilon} (u - v) (\eta_t + \Delta \eta) dx dt - \int_{t_3}^t \int_{\partial B_\varepsilon} \eta \frac{\partial}{\partial n} (u - v) d\sigma dt \\ &\quad + \int_{t_3}^t \int_{\partial B_\varepsilon} (u - v) \frac{\partial \eta}{\partial n} d\sigma dt \\ &= - \int_{t_3}^t \int_{\partial B_\varepsilon} \eta \frac{\partial}{\partial n} (u - v) d\sigma dt + \int_{t_3}^t \int_{\partial B_\varepsilon} (u - v) \frac{\partial \eta}{\partial n} d\sigma dt. \end{aligned} \quad (17)$$

By (2),

$$\left| \int_{t_3}^t \int_{\partial B_\varepsilon} (u - v) \frac{\partial \eta}{\partial n} d\sigma dt \right| \leq C\varepsilon \rightarrow 0 \quad \text{as } \varepsilon \rightarrow 0. \quad (18)$$

By (8) and (16),

$$\limsup_{\varepsilon \rightarrow 0} \left| \int_{t_3}^t \int_{\partial B_\varepsilon} \eta \frac{\partial}{\partial n} (u - v) d\sigma dt \right| \leq C\delta. \quad (19)$$

Since $\delta > 0$ is arbitrary, by (19) there holds

$$\lim_{\varepsilon \rightarrow 0} \left| \int_{t_3}^t \int_{\partial B_\varepsilon} \eta \frac{\partial}{\partial n} (u - v) d\sigma dt \right| = 0. \quad (20)$$

Letting $\varepsilon \rightarrow 0$ in (17), by (18) and (20),

$$\int_{B_{R_1}} (u - v)(x, t) h(x) dx = \int_{B_{R_1}} (u - v)(x, t_3) \eta(x, t_3) dx = 0. \quad (21)$$

We now choose a sequence of functions $h_i \in C_0^\infty(B_{R_1})$ converging to $\chi_{\{u > v\}}$ a.e. $x \in B_{R_1}$ as $i \rightarrow \infty$. Putting $h = h_i$ in (21) and letting $i \rightarrow \infty$,

$$\int_{B_{R_1}} (u - v)_+(x, t) dx = 0 \quad \forall t_3 < t \leq t_2. \quad (22)$$

By interchanging the role of u and v we get

$$\int_{B_{R_1}} (v - u)_+(x, t) dx = 0 \quad \forall t_3 < t \leq t_2. \quad (23)$$

Hence by (22) and (23),

$$\begin{aligned} & \int_{B_{R_1}} |v - u|(x, t) dx = 0 \quad \forall t_3 < t \leq t_2 \\ \Rightarrow & u(x, t) = v(x, t) \quad \forall 0 < |x| \leq R_1, t_3 < t \leq t_2. \end{aligned} \quad (24)$$

Hence u has removable singularities on $\{0\} \times (t_3, t_2)$. Since $0 < t_1 < t_3 < t_2 < T$ is arbitrary, u has removable singularities on $\{0\} \times (0, T)$ and the theorem follows.

Proof of Theorem 2: Theorem 2 follows by an argument very similar to the proof of Theorem 1 but with (3) replacing (2) in the argument.

An alternate proof of Theorems 1 and 2: We will show that when (2) (respectively (3)) holds, then u has removable singularities at $\{0\} \times (0, T)$. Suppose (2) holds if $n \geq 3$ and (3) holds if $n = 2$. We first observe that by the previous argument for any $0 < t_1 < t_2 < T$ u satisfies (12) and $u \in L_{loc}^\infty(\Omega \times (0, T))$. Let $\overline{B}_{R_1} \subset \Omega$ and let w be the solution of

$$\begin{cases} w_t = \Delta w & \text{in } B_{R_1} \times (t_1, t_2) \\ w = u & \text{on } \overline{B}_{R_1} \times \{t_1\} \cup \partial B_{R_1} \times (t_1, t_2). \end{cases}$$

By the maximum principle,

$$\|w\|_{L^\infty} \leq \|u\|_{L^\infty(B_{R_1} \times (t_1, t_2))} < \infty. \quad (25)$$

For any $\varepsilon > 0$, let

$$w_\varepsilon = \begin{cases} w - u + \varepsilon|x|^{2-n} & \text{if } n \geq 3 \\ w - u + \varepsilon \log(R_1/|x|) & \text{if } n = 2. \end{cases}$$

Then w_ε satisfies

$$\begin{cases} w_{\varepsilon,t} = \Delta w_\varepsilon & \text{in } (B_{R_1} \setminus \{0\}) \times (t_1, t_2) \\ w_\varepsilon \geq u & \text{on } \partial B_{R_1} \times (t_1, t_2) \cup \overline{B}_{R_1} \times \{t_1\}. \end{cases}$$

By (2), (3), and (25) there exists a constant $0 < r_0 < R_1$ such that

$$w_\varepsilon \geq 0 \quad \text{on } \partial B_{r_1} \times [t_1, t_2]$$

for all $0 < r_1 \leq r_0$. By the maximum principle in $(B_{R_1} \setminus B_{r_1}) \times (t_1, t_2)$,

$$\begin{aligned} & w_\varepsilon \geq 0 \quad \text{in } (B_{R_1} \setminus B_{r_1}) \times (t_1, t_2) \\ \Rightarrow & \begin{cases} w - u + \varepsilon|x|^{2-n} \geq 0 & \forall r_1 \leq |x| \leq R_1, t_1 \leq t \leq t_2 \quad \text{if } n \geq 3 \\ w - u + \varepsilon \log(R_0/|x|) \geq 0 & \forall r_1 \leq |x| \leq R_1, t_1 \leq t \leq t_2 \quad \text{if } n = 2 \end{cases} \\ \Rightarrow & w \geq u \quad \forall 0 < |x| \leq R_1, t_1 \leq t \leq t_2 \quad \text{as } r_1 \rightarrow 0, \varepsilon \rightarrow 0. \end{aligned} \tag{26}$$

Similarly by considering the function

$$v_\varepsilon = \begin{cases} w - u - \varepsilon|x|^{2-n} & \text{if } n \geq 3 \\ w - u - \varepsilon \log(R_1/|x|) & \text{if } n = 2 \end{cases}$$

and applying the maximum principle and letting $\varepsilon \rightarrow 0$ we get

$$w \leq u \quad \forall 0 < |x| \leq R_1, t_1 \leq t \leq t_2. \tag{27}$$

By (26) and (27) we get (24) and Theorem 2 and Theorem 3 follows.
